Submission

The rendered python scripts (pdf) are uploaded to the Whiteboard.

Everything else can be found in the GitHub repo below.

Analysis was conducted accross two axes of granularity: 1. The annotation level (how many different cell types were annontated) * L1 - 8 cell types * L2 - 30 cell types 2. The sample size * Full dataset (161k cells) * Subsamples: 10k, 25k

The analysis for the different combinations is available in the corresponding notebooks:

	L1	L2
10k	✓	✗
25k	✓	✓
Full dataset (161K)	✓	✓*

* Note: Functional annotation (GO enrichment) was only conducted on the L2/161K dataset.

Code

- Processing and application of statistical/ML methods is done via standalone python scripts.
- Analysis and plot generation done within python notebooks

The entire codebase is available via GitHub:

https://github.com/inbar/data_science_for_life_science_summer_2026_project_python
